DETAILED ACTION

Allowable Subject Matter

Claims 19 – 23 and 26 are allowed.

The following is an examiner's statement of reasons for allowance:

Mansky *et al.* (U.S. Pat. No. 6,438,497 B1) teach an apparatus for materials characterization, wherein the apparatus comprises an array of sensors and an infrared detector, such as an infrared camera, operatively associated with each sensor for measuring a response in a detection method for an analyte. However, Mansky *et al.* in addition to the cited prior art neither teach or fairly suggest a method for assessing the uniformity in temperature distribution in regions of a sensor comprising a sensor array, which comprise conduction paths, the method comprising: applying a voltage to the sensor to cause the sensor to dissipate energy; capturing an image of the sensor with an infrared camera to generate a thermographic image of the sensor while the sensor is dissipating energy; identifying the conduction paths in the sensor array as regions having a higher temperature than their surroundings; calculating a measure of the uniformity of the temperature distribution of the image; and assessing the uniformity of the temperature distribution in the regions using the calculated measure, wherein a higher measure value corresponds with a more uniform temperature distribution. Furthermore, the cited prior art neither teach or fairly suggest a method for identifying the conducting path of a sensor comprising a sensor array, the method comprising: applying a voltage to the sensor to cause the sensor to dissipate energy; capturing an image of the sensor with an infrared camera to generate a thermographic image of the sensor while the sensor is dissipating energy; and identifying the

conduction paths in the sensor array as regions having a higher temperature than their surroundings.
